

Drainage

Jovas has different kinds of drainage systems in her program, from stainless steel gutters up to pipe systems.

Pipe that is placed in concrete and after hardening, the upper side of the slot is taken of. With this a drainage slot arises with a width of 12mm.

Load class: depending on the quality of the concrete, but maximal B125.

To be used in: central corridors, milk stables and stables with calves, slurry storage places and cleaning places

Pipe with, on the upper side, openings of $\varnothing 10\text{mm}$ every 50mm. Straw and big parts of dirt can't go through these openings, so the pipe can't block up. This drainage system is very suitable for spaces with straw.

Load class: A15-C250

To be used in: stables with calves and slurry storage places

Pipe with, on the upper side, little pipes of +/-80mm high, every 50mm. Straw and big parts of dirt can't go through these little pipes, so the pipe can't block up. This drainage system is suitable for spaces with straw.

Load class: A15-D400 (depending on the quality of the concrete)

To be used in: stables with calves and slurry storage places

Stainless steel gutter with stainless steel slat that can be placed in a concrete floor and between prefab floors (in a groove).

Load class: A15

To be used in: central corridors, milk stables, showers

Stainless steel "concealing" gutter that can be placed in a concrete floor.

Load class: A15-C250

To be used in: central corridors, milk stables, showers

We can deliver the polyester concrete gutters in different versions with several different kinds of slats. They can be delivered in load classes A15 up to F900 and can be used in different situations, depending on the used version. On our production line in Poland, we can also make custom made products.
